

ABSTRACT OF THE DISCLOSURE

A disposable examination glove is made by forming a disposable glove from a flexible material; coating the interior surface of the glove with a liquid carrier, Aloe Vera, and at least one alpha hydroxy acid; and removing liquid carrier from the coating to form a substantially dry coating of Aloe Vera and the at least one alpha hydroxy acid on the interior surface of the glove. The dry coating is bonded to the interior surface of the glove so that the coating contacts the hand of a person wearing the glove.
